3rd Grade Project Beyond: The Human Brain

Third Grade Project Beyond students have been studying about the human brain. They have taken a three-dimensional approach to their learning by creating craft collages of neurons and making a puzzle of the main parts of the human brain. As we have learned what each of the main lobes of the brain control, we have been painting those lobes onto our "heads". Next we'll label them with the activities that are controlled by each part. Our final activity will be to design a public education campaign to help other kids know how to keep their brains safe and healthy!
